Workflow contract

A workflow is versioned YAML with inputs, variables, typed nodes, and directed edges. Pydantic validates shape. Preflight checks topology, templates, services, models, and node-specific requirements. Compilation resolves each node type and builds executable LangGraph behavior.

1. Builder or YAML defines the graph.
2. Schema validation rejects malformed contracts.
3. Preflight reports actionable issues.
4. Compiler binds node runners and conditional routes.
5. Runtime validates outputs and persists progress.
